

Explorations in Wealth and Chance

OIDD 325: *Grace Jiang*

The Problem

- Wealth Inequality
- Create a model to represent situation
- See how factors may contribute to wealth inequalities
 - Varying access to resources
 - Varying initial wealth

2-Cluster

Initial Resource Inequality

Wealth Growth

Initial Wealth Inequality

2-Cluster Experiment

Overview

- **Overview:** Turtles split into two clusters
- **Experimental Variables:** distance to manna, cluster density
 - **Pink Cluster** = Less access to resources
 - **Blue Cluster** = More access to resources
- **Result Measures:** Mean difference in wealth, % of total wealth per cluster
- **Connection to Real Life:** Different groups have varying access to resources that affect people even with equal starting wealths

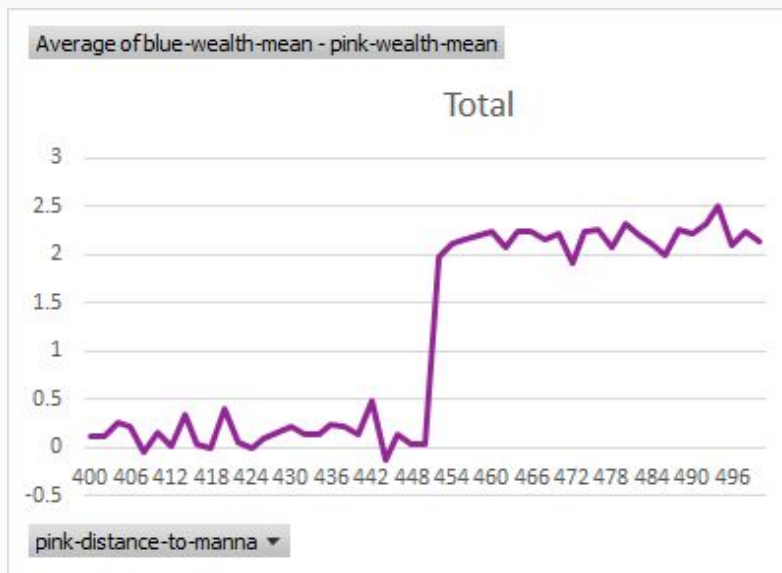

Hypothesis

- Small differences in access to resources can cause exponential increases in wealth disparity
- Group uniformity will not have an impact on wealth generation

Results

difference in mean wealths

pink distance to manna

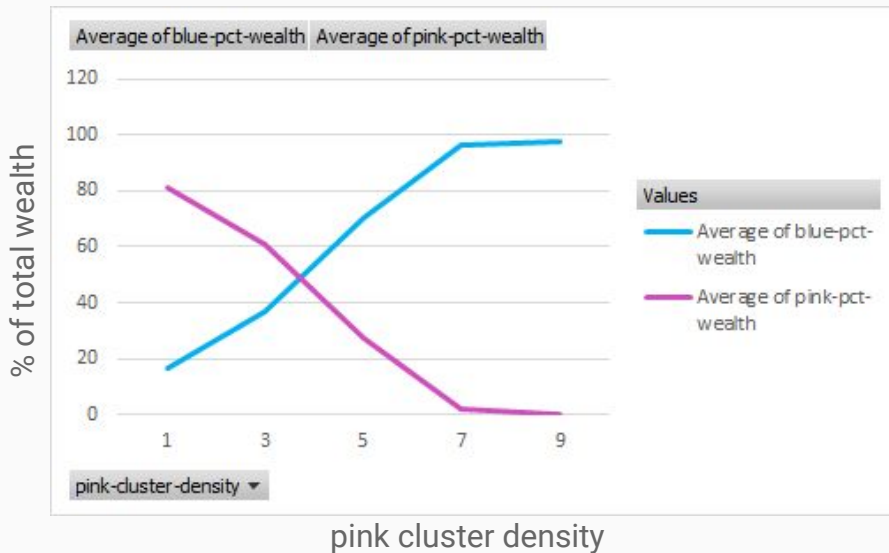

% of total wealth

pink distance to manna

Results

Wealth Growth Experiment

Overview

- **Overview:** “Rich” and “Poor” turtles
- **Experimental Variables:** initial wealth, interest rate, cost of living
 - **Pink Cluster** = No initial starting wealth
 - **Blue Cluster** = Varying initial starting wealth
- **Result Measures:** Mean difference in wealth, % of total wealth per cluster
- **Connection to Real Life:** Different groups have varying initial starting wealths that affect people even with equal access to resources

Hypothesis

- Slightly higher initial wealth creates larger proportionate difference in wealth disparity
- “Rich get richer, poor get poorer”

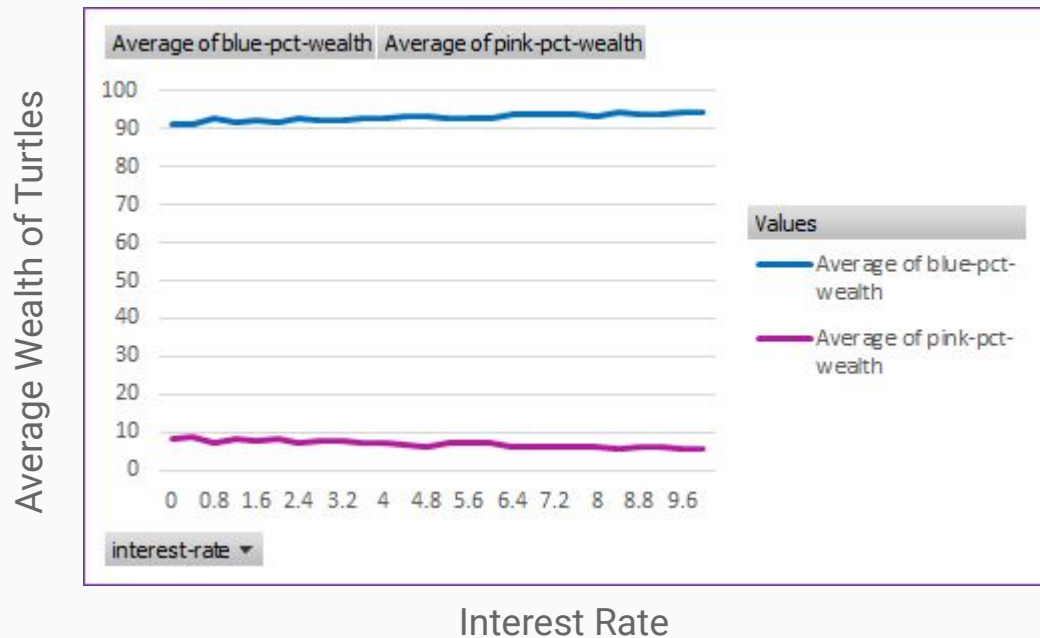

Results

Results

Rich turtles = blue
Poorer turtles = pink

Conclusion

- Factors like access to resources and presence of initial wealth can contribute to the issue of wealth disparity
- Start conversation of urgency to acknowledge and address wealth disparities that impact many lives
 - Goal to make the future of our society more equitable
